

FALL ZONE

Public Comments: Concerns were raised regarding the fall zone of high voltage power lines as it relates to certain requirements of the U.S. Department of Housing and Urban Development's Federal Housing Administration loan grants.

Project Team Analysis: Transmission power lines are designed in accordance with industry standards and engineering practices, including relevant provisions of the National Electrical Safety Code®, and to satisfy specifications utilized by CPS Energy at the time of construction for the reliable and safe delivery of energy. Provided that the transmission structures have not been materially affected by other factors, such as third parties or adverse weather, CPS Energy believes the risk of a transmission tower collapsing is minimal.
