

October 2, 2009

Dear CPS Energy Customer,

CPS Energy, your natural gas and electric provider, requests your cooperation with a transmission project.

To improve electric reliability in our growing community, we must rebuild a portion of a high voltage electric overhead transmission line and install a second electric transmission circuit (wire) extending from our electric substation located near Perrin Beitel and Longvale Drive to our electric substation located near Old Seguin Road and Mac Rae in Kirby. This transmission line exists both within parcels owned by CPS Energy and within easements. These easements may be on or adjacent to your parcel. Some Lattice-type transmission towers will be replaced by slender steel monopoles. Not all structures will be replaced. Please refer to the brochure included in this mailing for more details.

Construction is tentatively scheduled to begin in July 2010. Pre-construction activities such as surveying and underground facility locating must begin immediately. CEC (Civil Engineering Consultants) has been contracted to perform surveying work. They will be locating property pins and easement lines relevant to the construction of this project. Activities such as tree trimming and gate and/or fence construction will begin prior to construction. Please provide access to this easement area and remove any encroachments, if necessary.

If you have any questions about this important project, please call me at (210) 353-3477. Thank you again so much for your cooperation and understanding as we seek to continue delivering dependable, affordable energy to you and your neighbors!

Sincerely,

*Barbara Broll*
